#### Overview

- CleanSpace One
- Rospace Requirements & Framework
- Evaluation of Simulation Toolkits
- Layout of the Physics Engine
- Validation of Orbit and Attitude Propagation

#### Our Mission

# **Clean Space One**

- Capture and de-orbit SwissCube
  - increase awareness and responsibility in regard to orbit removal
  - demonstrate technologies needed for ADR
- Challenges:
  - → high tumbling rate
    - uncooperative rendezvous

# **ROSpace Simulator**

## **ROSpace – Requirements**

- *Requirement 1:* Publishable & Reproducible
- **Requirement 2:** Verification
- Requirement 3: Model Accuracy
- *Requirement 4:* Customizable

#### Evaluation of Simulation Toolkits

#### Toolkit – Evaluation Criteria

• *Criterion 1:* Completeness

• Criterion 2: Flexibility

Criterion 3: User-Friendliness

#### **Options for Capture Simulator**

- Software with GUI: STK (commercial), GMAT (open-source)
  - → strength in high-level mission simulation (orbital maneuvers, coverage planning)
- Software libraries: 42 (C++), Basilisk (C++), TUDAT (C++), OREKIT (Java)
   → which one to chose?

# **Options for Capture Simulator**

	42	Basilisk	TUDAT	OREKIT
+	<ul> <li>C++</li> <li>Multi-body dynamics</li> <li>Contact forces</li> <li>Attitude dynamics</li> </ul>	<ul> <li>C++</li> <li>Actuator &amp; sensor models</li> <li>Attitude dynamics</li> </ul>	<ul> <li>C++</li> <li>User-Friendly (tutorials)</li> </ul>	<ul> <li>Validated &amp; successfully tested</li> <li>Well documented</li> <li>Variety of sophisticated models</li> </ul>
-	<ul> <li>Deprecated atmosphere model</li> <li>Only low coefficient gravity models</li> <li>No tide models</li> </ul>	<ul> <li>Documentation</li> <li>Only general purpose models listed</li> </ul>	<ul> <li>Simple radiation pressure model</li> <li>Not tested in real world</li> <li>No attitude dynamics</li> </ul>	<ul><li>Java</li><li>No attitude dynamics</li></ul>

#### Layout of the Physics Engine

# **General Layout**

 Engine embedded in ROS environment

Rospy provides
 communication tools
 between ROS-nodes

 Clock interface separated from PropagationNode

## **Clock Library**

eSpace

-

# **Clock Library**

 Handles time based on commands from first caller class

 Multiple calls from different nodes result into error

 Time can be manipulated with developed GUI

![](_page_14_Picture_5.jpeg)

## **Clock Library**

# Validation of Orbit Propagation

![](_page_26_Picture_1.jpeg)

![](_page_26_Picture_2.jpeg)

# EnviSat Model

- Simulation results compared against precise orbit data sets of EnviSat for February 2012
- Mass: 7834 kg
- Perfectly nadir pointing attitude assumed
- Solar Panel oriented in direction of best lighting conditions
- Shadowing effect neglected
- Assumptions made for surface material
- Body size Sensitivity Analysis

![](_page_27_Picture_8.jpeg)

![](_page_27_Picture_9.jpeg)

# Sensitivity Analysis

- 12 different sizes for masses between 7800 8000 kg with 10kg increment
- Solar panel areas: 40 m<sup>2</sup> (left) and 60 m<sup>2</sup> (right)
- Period: 04.02.2012 at 21:55:26 06.02.2012 at 00:23:25

![](_page_28_Figure_4.jpeg)

# **Short-Term Propagation**

![](_page_29_Figure_1.jpeg)

# Long-Term Propagation

## Validation of Attitude Propagation

![](_page_32_Picture_1.jpeg)

![](_page_32_Picture_2.jpeg)

### **Attitude Propagation**

- CSSWE Passive Magnetic Attitude Control
- 3U CubeSat with mass of 3 kg
- Initial angular velocity:  $(\omega_x, \omega_y, \omega_z) = (10, 5, 5) \left| \frac{\circ}{s} \right|$

![](_page_33_Figure_4.jpeg)

### **Attitude Propagation**

- CSSWE Passive Magnetic Attitude Control
- 3U CubeSat with mass of 3 kg
- Initial angular velocity:  $(\omega_x, \omega_y, \omega_z) = (10, 5, 5) \left[\frac{\circ}{s}\right]$

![](_page_34_Figure_4.jpeg)

![](_page_35_Picture_0.jpeg)

![](_page_35_Picture_1.jpeg)

![](_page_35_Picture_2.jpeg)

#### **Additional Slides**

![](_page_36_Picture_1.jpeg)

![](_page_36_Picture_2.jpeg)

- More than 23'000 debris larger than 5 cm orbiting Earth
- Adopted "Post Mission Disposal" (PMD) guidelines do not prevent completely debris increase
  - → Active debris removal required

![](_page_37_Picture_5.jpeg)

![](_page_37_Picture_6.jpeg)

Augments on-board and on-ground sensor readings

- Implemented: Black box model
  - returns bearing angles based on relative position and adds artificial noise

Rendezvous Sensors			
	Sensor 1		
	Sensor n		
G	Ground Based Sensor		
	Sensor 1		
	Sensor n		
	AOCS Sensors		
	Star Tracker		
	Sun Sensors		
	GNSS		
	IMU		

![](_page_38_Picture_5.jpeg)

![](_page_38_Picture_6.jpeg)

Represents all on-board software

- Implemented: Relative navigation filter
  - estimates the relative state of chaser
     based on inputs from relative navigation
     sensors and on-board state estimation

![](_page_39_Figure_4.jpeg)

![](_page_39_Picture_5.jpeg)

- Models resulting thrust forces based on flight software commands
- Implements: magneto-torque & simple dipole model

![](_page_40_Figure_3.jpeg)

![](_page_40_Picture_4.jpeg)

![](_page_40_Picture_5.jpeg)

- Models forces and torques acting on the spacecraft and integrates its state (position, velocity, attitude, ...)
  - → Physics engine

![](_page_41_Figure_3.jpeg)

![](_page_41_Picture_4.jpeg)

![](_page_41_Picture_5.jpeg)

# **Simulation Time**

- Propagator node updates simulation time
- Simulation time represented as integer in [ns]
   no floating point error
  - → python integer → 'long' integer object
- TStepSize \* PublishFreq = RealTFactor
- Start/Pause: starts/stops only simulation time update not ROS nodes
- Simulation warns if real-time factor cannot be achieved

![](_page_42_Picture_7.jpeg)

![](_page_42_Picture_8.jpeg)

![](_page_42_Picture_9.jpeg)

# **Box-Wing Model**

- Satellite modeled as box with wings as solar panels
- Discretized into n volumes with mass  $\delta m$
- Surface discretized into m surfaces with area  $\delta A$
- Solar Panels 2D planes with fixed direction
- No shadowing effect implemented

![](_page_43_Figure_6.jpeg)

![](_page_43_Picture_7.jpeg)

![](_page_43_Picture_8.jpeg)

## **Attitude Propagation**

 Gravity Gradient Stabilization inspired by NASA's Transit Satellites

6 booms with point masses of 1.4 kg at end

• Inertia tensor is diagonal matrix with  $I_x = I_y \gg I_z$ 

![](_page_44_Picture_4.jpeg)

![](_page_44_Picture_5.jpeg)

![](_page_44_Picture_6.jpeg)

#### **Attitude Propagation**

![](_page_45_Figure_1.jpeg)

eSpace

![](_page_45_Picture_2.jpeg)

#### EnviSat – Absolute Error for 40m<sup>2</sup>

![](_page_46_Figure_1.jpeg)

![](_page_46_Picture_2.jpeg)

### EnviSat – Absolute Error for 60m<sup>2</sup>

![](_page_47_Figure_1.jpeg)

![](_page_47_Picture_2.jpeg)

### **Dipole Model**

- One hysteresis loop assumed for every field strength cycle
- Real hysteresis rod follows different loop
- $H_c \rightarrow$  Coercive Force
  - $B_r \longrightarrow \text{Remanence}$
  - $B_s \longrightarrow$  Saturation Induction

![](_page_48_Figure_6.jpeg)

![](_page_48_Picture_7.jpeg)

![](_page_48_Picture_8.jpeg)

#### **Provided File Data**
